

The Modular Tactical Belt is designed to complement personal equipment and to carry personal gear and weapons. It also serves as additional protection of the lower parts of the body thanks to an optional ballistic insert.

The belt consists of several parts, each providing a different function in the belt system. These parts and functions are then combined with each other as required by the user.

### Belt parts:

#### Shooting belt

The shooting belt is reinforced with PE foam and covered by individual panels with the MOLLE carrying system, always 2 elements vertically and horizontally. Each element is sewn to the belt only at the top and bottom and there is always a passage between the belt and the element. On the inside, the belt is covered with VELCRO segments – loops for attaching the inner belt or ballistic belt.

#### Inner belt

It consists of a 40 mm strap with VELCRO loops on the entire length. Connecting it with the shooting belt by means of the connecting segments secures the belt against movement. The belt can be threaded through conventional belt loops. The inner belt can be worn as a regular belt in trousers.

#### Connecting segments

Connecting segments are parts of a 40 mm strap, with 10 to 20 cm in length, covered with VELCRO hooks on both sides. The segments can be easily removed from the belt to prevent them from getting caught on clothing.

#### Rescue belt

The rescue belt is made of a 40 mm strap with an adjustable heavy-duty buckle and a heavy-duty drag handle. It passes just below the MOLLE system of the shooting belt and ensures its secure fastening on the user's body. It can be variably threaded under or above the individual MOLLE elements and used to carry, for example, a thigh pistol holster, etc.

#### Ballistic belt

The ballistic belt is approximately 2 cm wider than the shooting belt and can be attached via VELCRO hooks to the inner side of the shooting belt. It can be used with a ballistic insert. If necessary, it can be inserted between the inner belt and the shooting belt using VELCRO panels.

#### Carrying straps (optional)

Shoulder straps attach to the loops of the shooting belt and distribute the weight of the whole Modular Tactical Belt to the hips and shoulders.

#### Use:

The inner belt is designed for use as a standard belt threaded through trouser belt loops. It keeps the entire system in one place and prevents the belt from sliding around the user's body. A fastened inner belt can be fitted with connecting segments, usually on the back and sides. This creates a platform that can be further fitted with the shooting belt or shooting belt and ballistic belt. The shooting belt can be fastened by means of the rescue belt threaded through the elements on the shooting belt. Using the front and back loops, carrying straps can be attached to the shooting belt, which can be tightened according to the user's height and the desired position of the belt. Combining all parts creates a protective belt that protects the user from firearm-fired projectiles and fragments of explosive devices. Also, magazine pouches and other gear can be attached. The rescue belt can be used as an emergency abseiling aid thanks to the heavy-duty loop at the front (not certified as a rescue aid due to the absence of leg straps). The additional carrying straps carry the weight of the entire system and prevent the belt from sliding downwards on the wearer's body.
